Fig.3-8 The focal length of a diverging lens is stated as a negative number.

Example 1 : A camera lens has a focal length 50mm = 0.05m. What is the diopter of the lens?

Example 2: Glasses have lenses of -2.5D. What is the focal length of the lenses?

Two lenses will have a combined focal length:

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$$

2. Formation of Images by thin lenses – use the 3 easy rays:

Fig.3-16, 3-17 The blue dots show the focal points.

Play the interactive and analyze the formation of images:

<http://www.physicsclassroom.com/Physics-Interactives/Refraction-and-Lenses/Optics-Bench/Optics-Bench-Refraction-Interactive>

The lens formula: $\frac{1}{f} = \frac{1}{o} + \frac{1}{i}$

o and i are object and image distances from the center of the lens with focal length f .
If i is on the same side of the lens as the o , take i as negative.

Magnification:

$$M = \frac{h_i}{h_o} = \frac{i}{o}$$

Fig. 3-18

Answer the questions in WS 4.

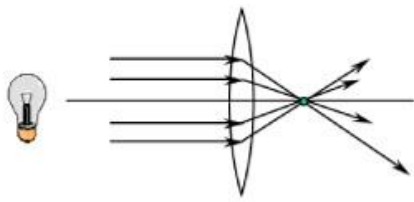

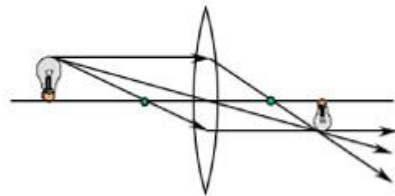

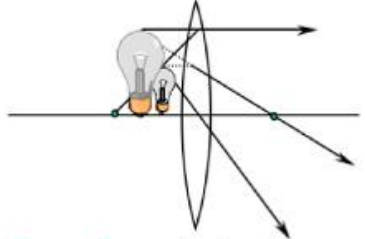

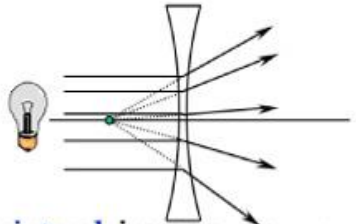

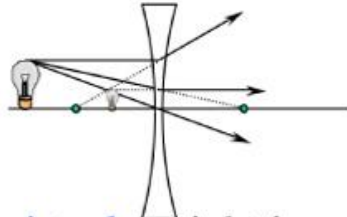

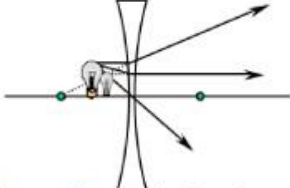

The magnification increases as the object distance decreases.

What else do you notice?

Fig.3-22

Summary of all possible cases

<p>converging lens, $o = \infty$</p>  <p>real image in focal point $M = i/\infty = 0$</p>	<p>converging lens, $o > f$</p>  <p>real inverted image $M = i/o > 0$ $M > 1$ or $M < 1$</p>	<p>converging lens, $o < f$</p>  <p>virtual upright image $M = i/o > 1$</p>
<p>diverging lens, $o = \infty$</p>  <p>virtual image in focal point $M = i/\infty = 0$</p>	<p>diverging lens, $o > f$</p>  <p>virtual upright image $M = i/o < 1$</p>	<p>diverging lens, $o < f$</p>  <p>virtual upright image $M = i/o < 1$</p>

Fig.3-23 Magnification is always less than 1 for diverging lenses.

3. Lens Aberrations

3a) Chromatic aberration

Fig.3-24 Taking rays closer to the axis (i.e. decreasing the aperture) decreases this aberration.

Chromatic aberration is compensated by combining 2 lenses with different index of refraction.

3b) *spherical aberration*

Copyright © 2008 by Elsevier Inc. All rights reserved.

Spherical aberration is compensated by combining a diverging and converging lens, or by making an aspherical lens.

3c) Distortion
